## List of Abbreviations

# 1 Introduction

This report serves as the documentation of the "Conveyor Belt" Semester-Project in Embedded Systems 2. The assignment for the project is provided in the appendix at Appendix A: Assignment

## 2 Scenarios

This chapter introduces the inner working of the software. This should be viewed in conjunction with the requirements from the table in Appendix B: Requirements.

### 2.1 Use Case Diagram

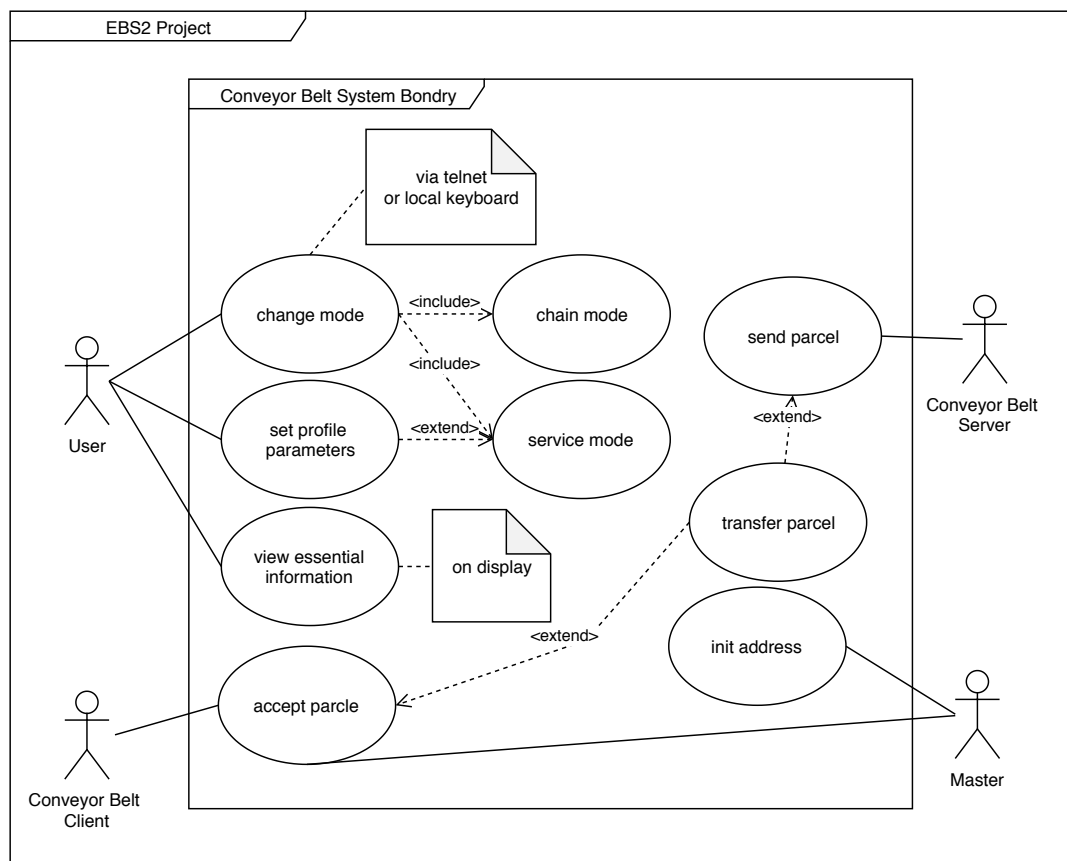

Abbildung 2.1: Use Case Diagram

## 2.2 Sequence Diagram

Abbildung 2.2: Sequence Diagram

## 2.3 Activity Diagram

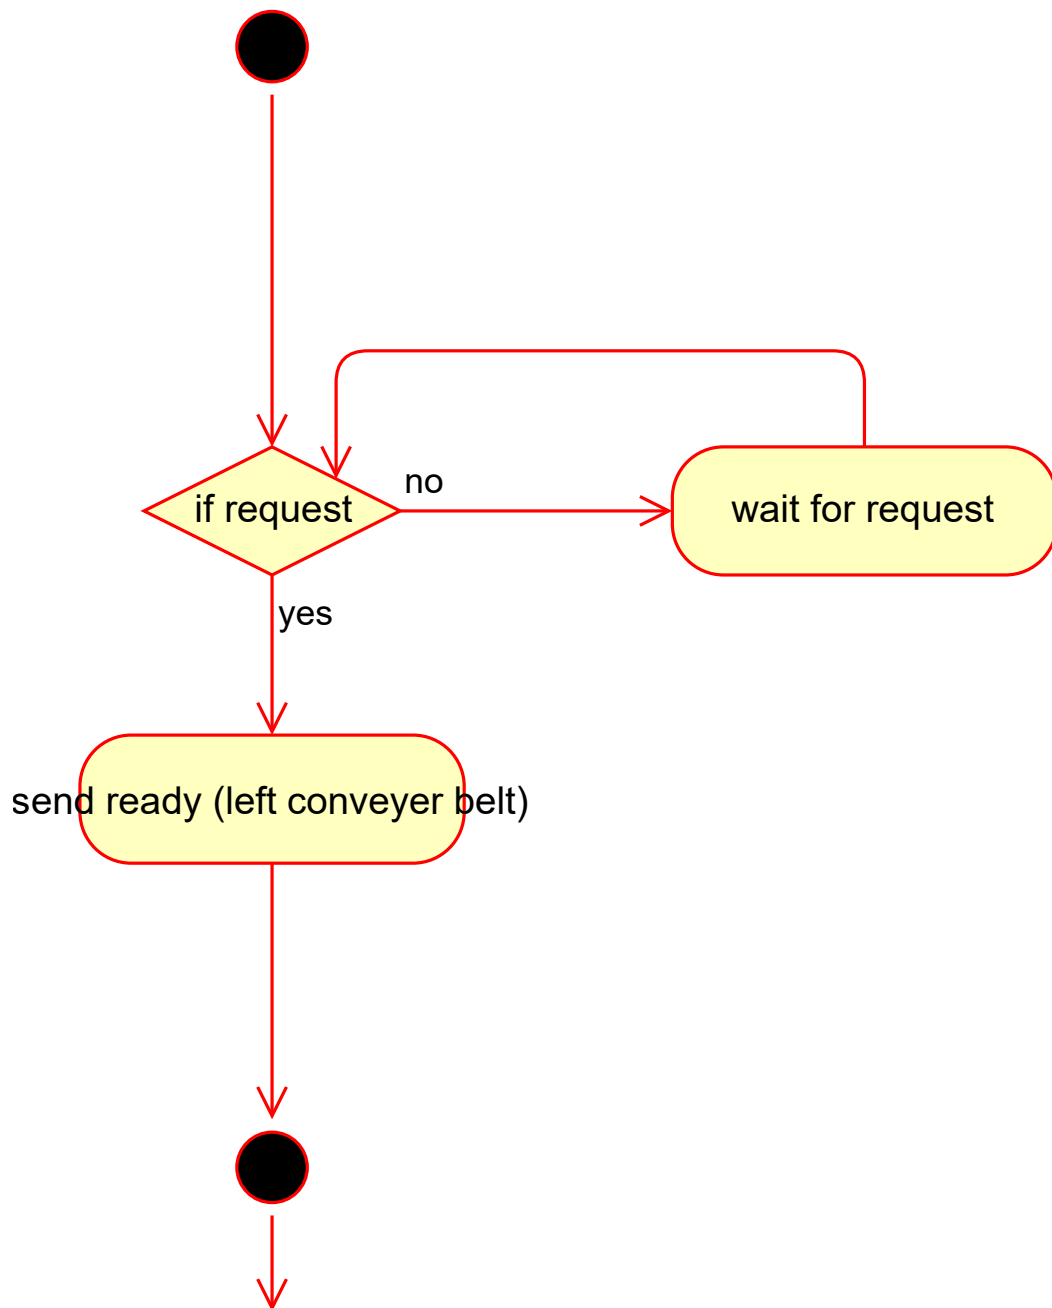

Abbildung 2.3: Activity Diagram Idle

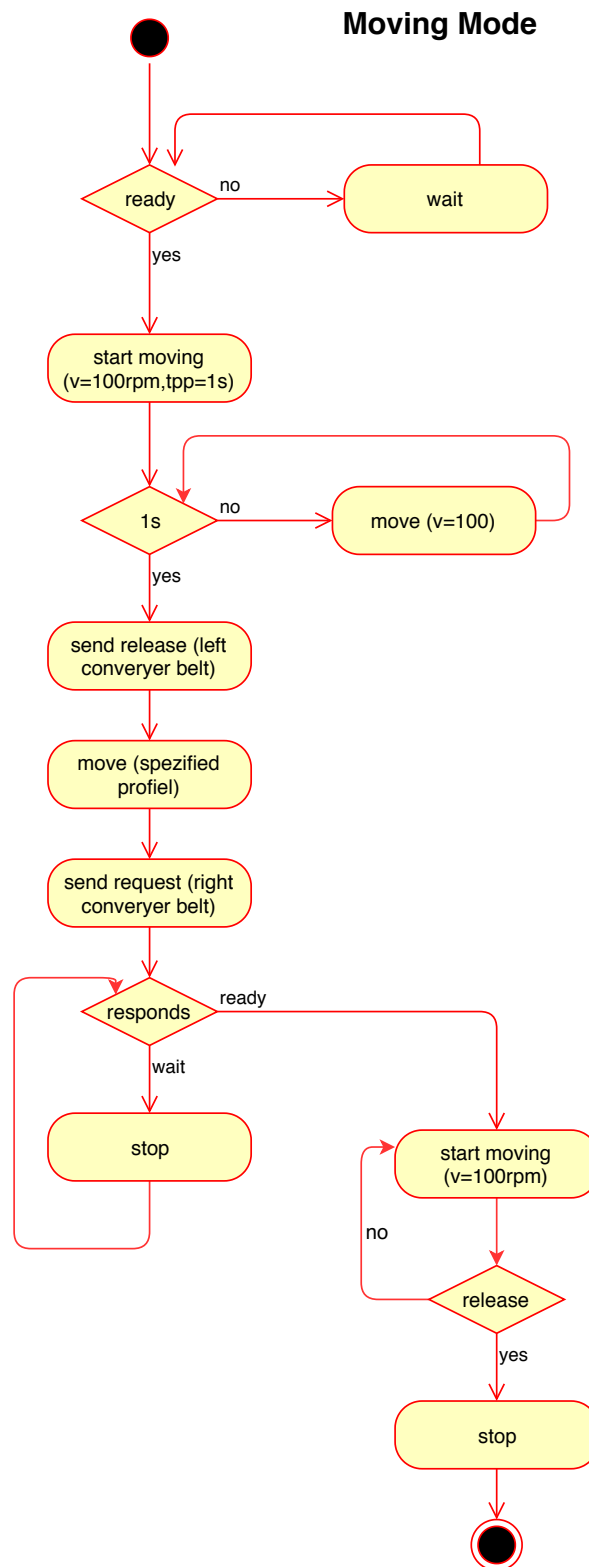

Abbildung 2.4: Activity Diagram Moving

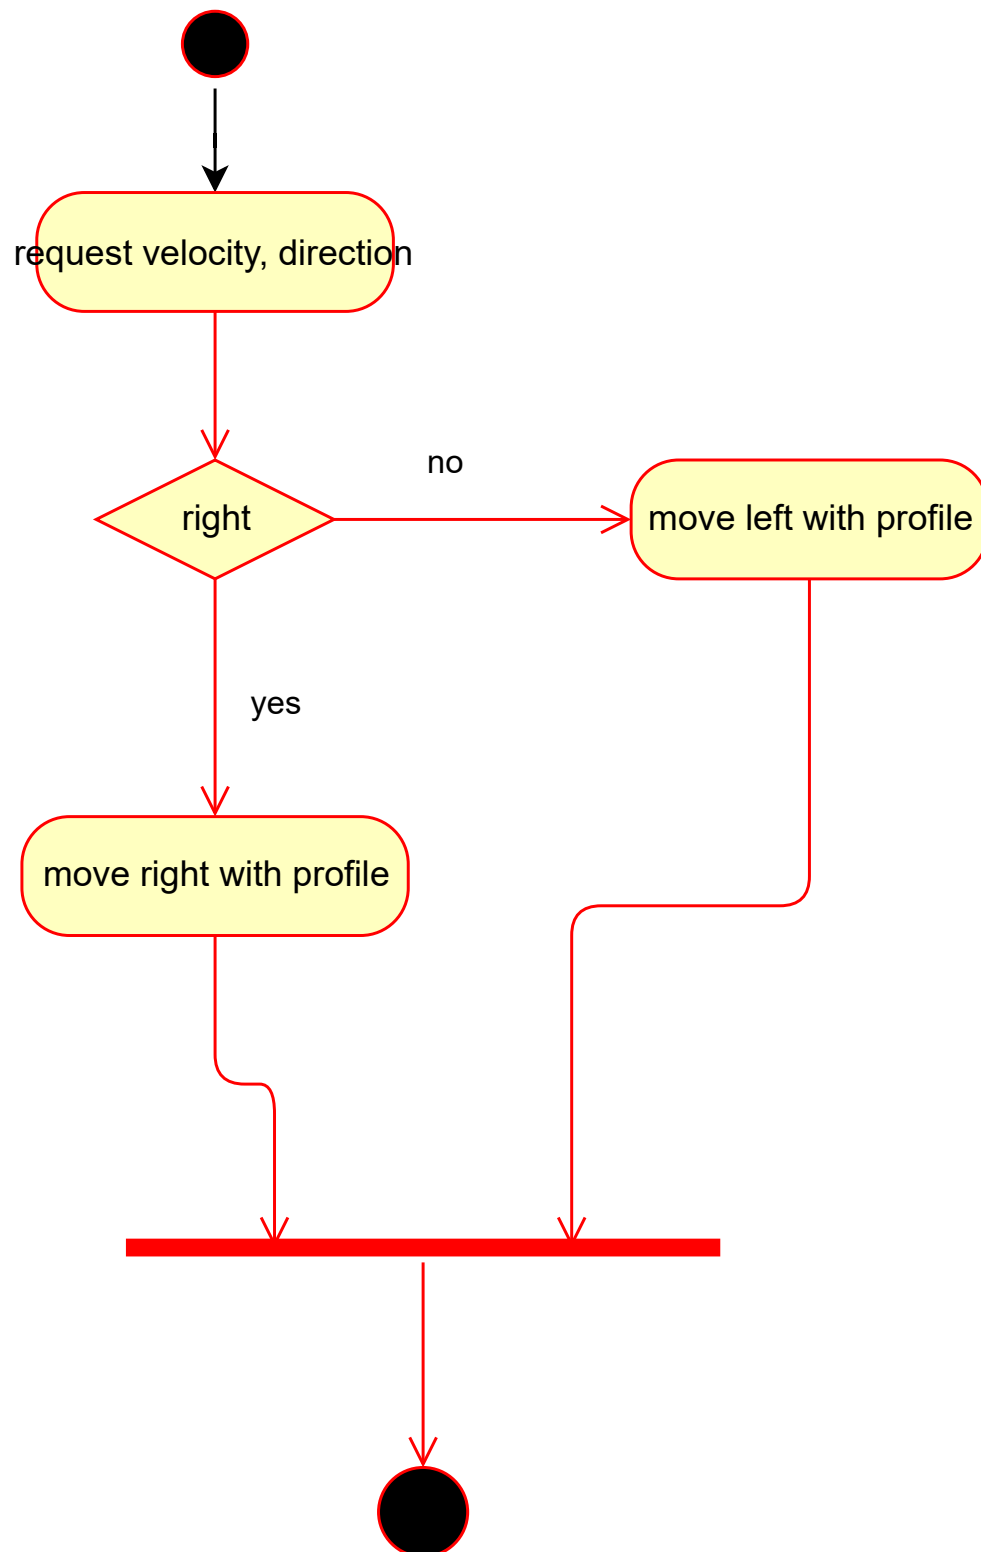

Abbildung 2.5: Activity Diagram Service

## 3 Design

### 3.1 Class Diagram

In the following class diagram, the classes that are marked with a blue header are passive whereas the classes with the orange header are active and can actually make decisions themselves. The classes with the white header are interfaces.

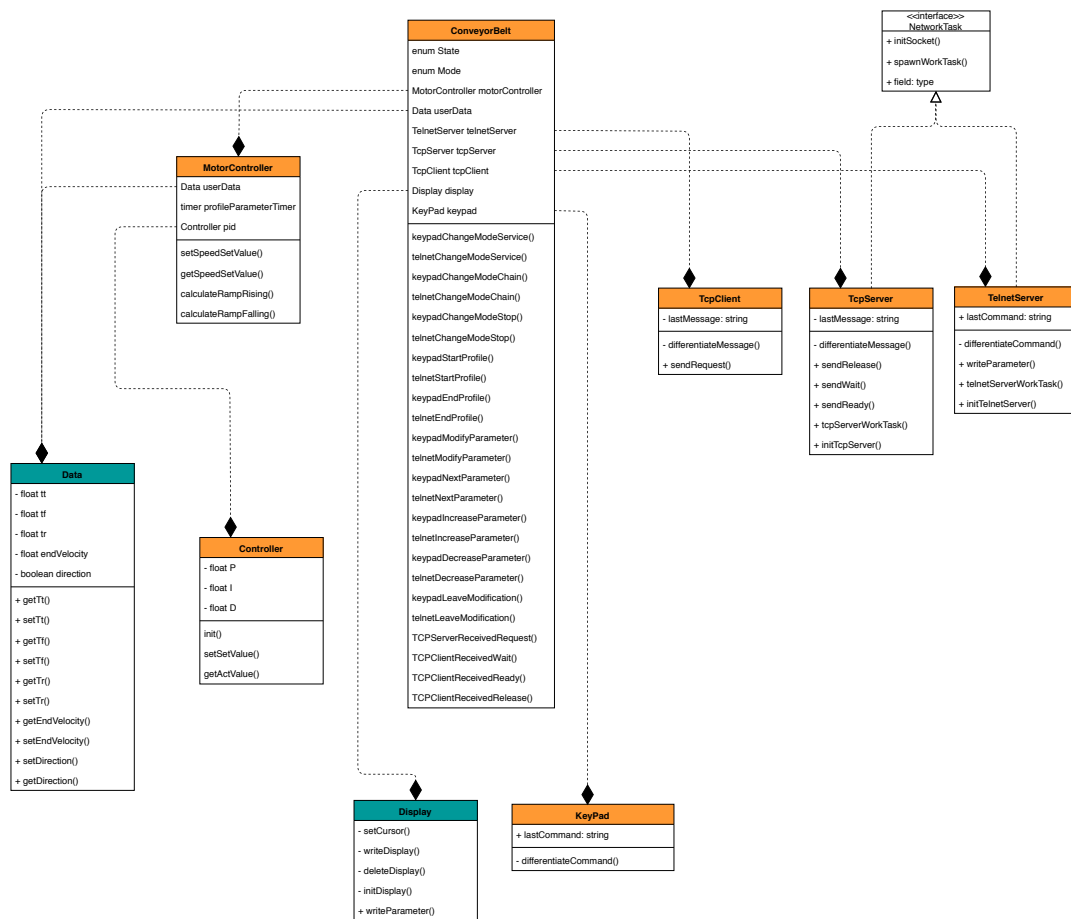

Abbildung 3.1: Class Diagram

## 3.2 State Diagram

The software is designed as three hierarchical state machines. The top-level diagram switches between the operation modes chain and service, which is shown in the first diagram. The following two diagrams show the lower level state machines.

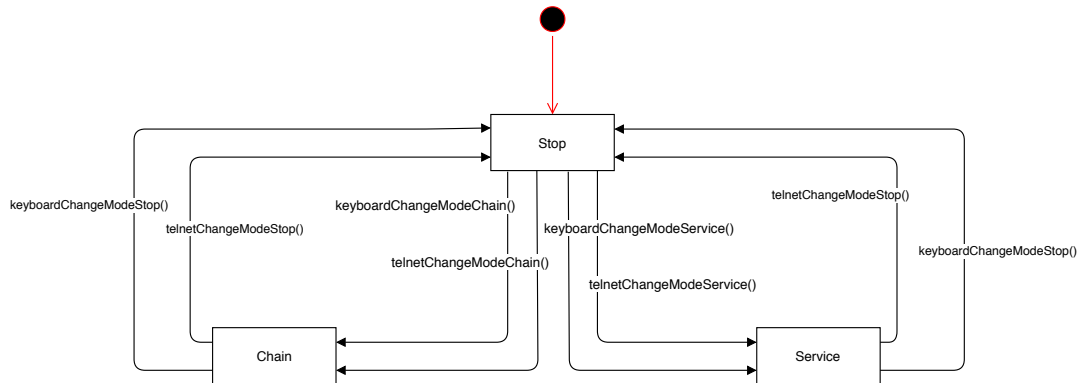

Abbildung 3.2: State Machine Mode

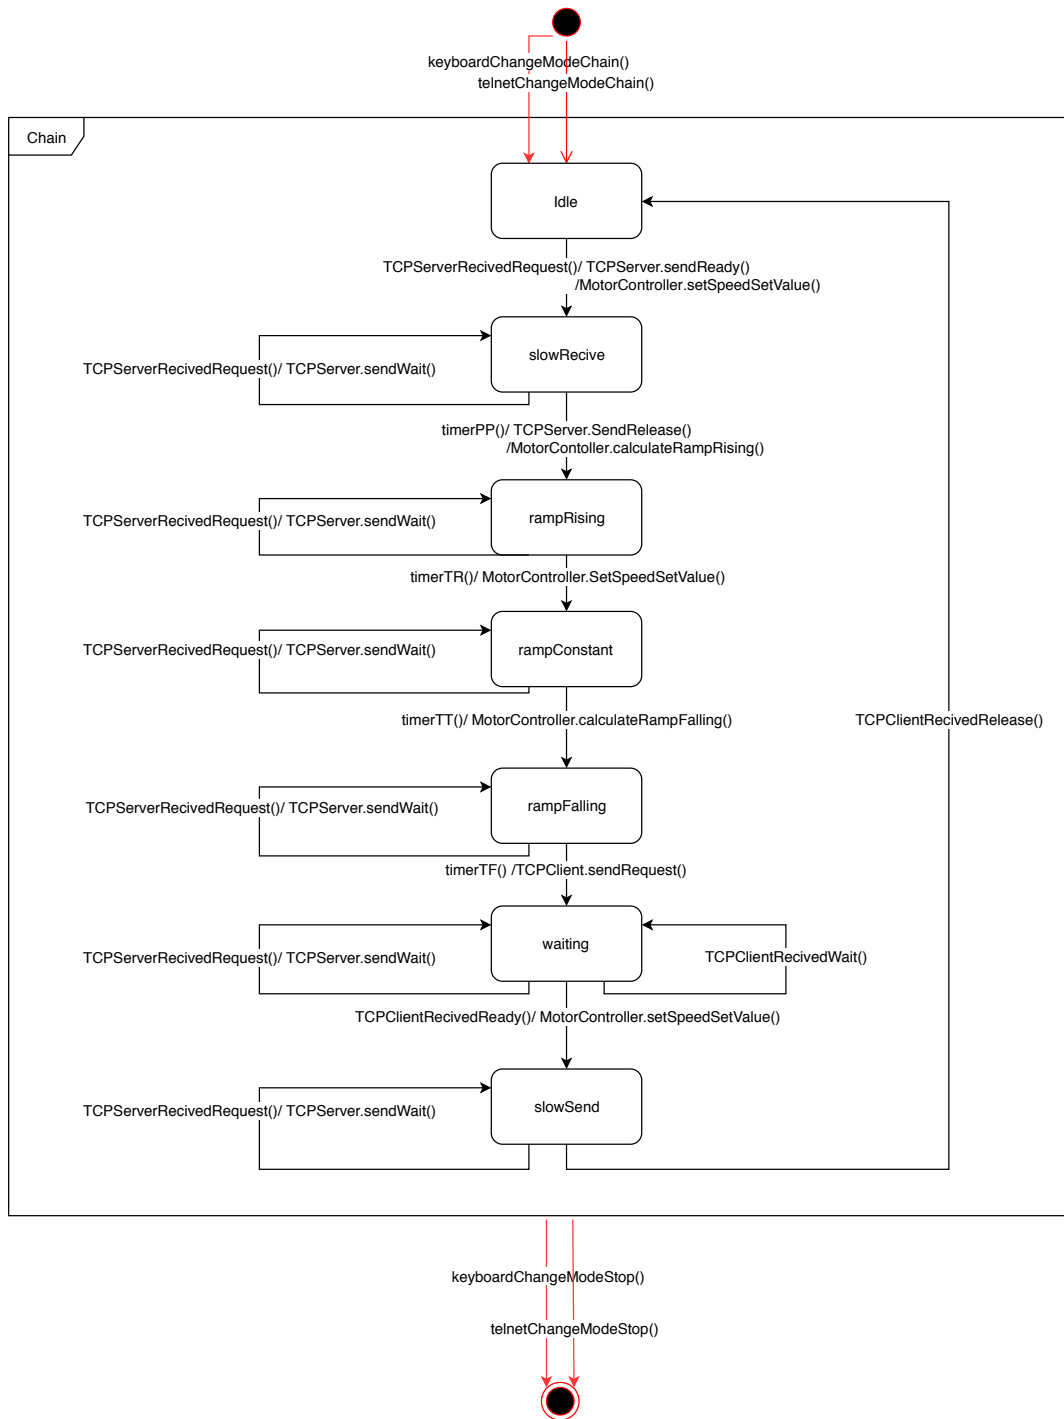

Abbildung 3.3: State Machine Chain

## 4 Change Notes

We had to change the original diagrams compared to the final version of the implementation. The changes and their reason are noted here.

- combine 3 state machines into one state machine (no hierarchical state machines allowed in the framework)
- changed keyboard name to keypad, as the name keyboard was already used in the files from Pilsan
- added init methods for server tasks

## 5 Summary

## Appendix A: Assignment

### 1. Basic Information

In this course a small project has to be carried out.  
An oral examination on the project result is part of the assessment.

### 2. Task:

The motor of the lab board powers a conveyor belt. The conveyor belts can either be operated locally or tied together to set up a closed chain. The purpose is to transport something along the chain (see fig. 1).

The movement of the conveyor belt shall follow the profile given in fig. 2.

Fig. 2

Where:

- $\omega$  = the revolution speed in rpm
- $t$  = time in s
- $a$  = 1800 rpm [amplitude]
- $t_r$  = 1 s [rise time]
- $t_f$  =  $t_r$  [fall time = rise time]
- $t_t$  = 8 s [total time]

Fig. 1

In local service operation mode it shall be possible to start the profile in either direction. Before starting the profile it shall be possible to modify the speed in the range of [100 ... 2200] rpm in steps of 100 rpm.

In chain operation mode the conveyor shall only pass parcels from the left to the right. It shall wait for a request from the conveyor belt to the left. If the request arrives and the conveyor belt is already performing a movement, it shall send "WAIT". Otherwise (if it is in idle state) it shall reply with "READY" and start a slow movement ( $a = 100$  rpm) for the payload passing time  $t_{pp} = 1$  s. Then it shall inform the conveyor belt to the left, that it has received the payload with "RELEASE". It then shall follow the specified profile to move the payload to the next belt. Then it shall ask the conveyor belt to the right with "REQUEST" if it can pass the payload. If it receives "WAIT" it shall stop. If it receives "READY" it shall start a slow movement ( $a = 100$  rpm) until it receives "RELEASE". Then it shall stop, return to idle state and accept new requests from the conveyor belt to the left.

The speed of the motor shall be controlled in a closed loop, the code for the control will be provided.

It shall be possible to operate the conveyor belt using either the local keyboard or a telnet connection.

Necessary information on the state of the system shall be shown on the board's display.

The functions needed to access the board's hardware are given (see "HwFunc.pdf" in the ILIAS).

It shall be taken into account that requirements changes could occur.

### 3. Organization:

The project should be carried out in teams of two students.

## Appendix B: Requirements

## Requirements Embeddes Systems Project

ID	Name	Description	Version	Status
1	Service movement	In service mode, the conveyer belt shall be able to move to both directions with the specified velocity profile.	1	In progress
2	Service speed	In service mode, speed of conveyer belt shall be modifiable by the user within 100 – 2200 rpm in steps of 100.	1	In progress
3	Chain movement	In chain mode, the conveyer belt shall move only be able to move into the right direction, towards the next conveyer.	1	In progress
4	Request left	If the controller is in idle state, the conveyer belt shall wait for request from left conveyer belt.	1	In progress
5	Send wait	If conveyer belt is moving state and server running on the controller gets a request, the server shall send “WAIT” to left conveyer belt.	1	In progress
6	Send read	If the conveyer belt is in idle state and server receives a request, the server shall send “READY” Signal to left conveyer belt	1	In progress
7	Slow movement	If server sent “READY”, conveyer belt shall start moving with $v = 100\text{rpm}$ for $t_{pp}=1$ second and get in moving state	1	In progress
8	Send release	After conveyer belt is moving tpp with $v = 100\text{rpm}$ , server shall send “RELEASE” to left conveyer belt	1	In progress
9	Profile movement	If server send “RELEASE”, conveyer belt start moving with specified profile	1	In progress
10	Send request	After conveyer belt is moving specified profile, client shall sent request to right conveyer belt	1	In progress
11	Get wait	If client get “WAIT”, conveyer belt shall be stop	1	In progress
12	Get ready	If client get “READY”, conveyer belt shall start moving with $v = 100\text{rpm}$	1	In progress
13	Get release	If client get “RELEASE”, conveyer belt shall be stop and get in idle state	1	In progress
14	Controller Communication I	The Server implemented on the slave, must be able to understand the commands Wait, Ready and Release.	1	In progress
15	Controller Communication II	The Client shall be able to send readable commands to the server of the next conveyor belt in line.	1	In progress
16	Motor control	The speed of motor during the constant drive time $t_t$ shall be controlled by closed loop PID.	1	In progress

17	PID Controller	The PID controller is already provided by the user of the system.	1	In progress
18	Operate mode	The conveyer belt shall be operated by local keyboard or telnet connection from a local PC in the Embedded Systems Laboratory U131.	1	In progress
19	Information Chain Mode	The parameters for the max velocity, the current mode of operation, direction, rise and fall time, state, shall be displayed on display board.	1	In progress
20	Information Service Mode	The parameters for the max velocity, the current mode of operation, direction, rise and fall time, state and cursor shall be displayed on display board.	1	In progress
21	Keyboard Button Actions Stop mode	If "0" pressed mode shall change to service mode, If "1" pressed mode shall change to chain mode;	1	In progress
22	Telnet Button Actions Stop mode	If "0" pressed mode shall change to service mode, If "1" pressed mode shall change to chain mode;	1	In progress
23	Keyboard Button Actions service mode	If "A" pressed conveyer belt start, With number buttons tr,tf,tt shall be modifiable, If "F" pressed mode shall change to stop mode With number buttons v shall be modifiable,	1	In progress
24	Telnet Button Actions service mode	If "A" pressed conveyer belt start, With number buttons tr,tf,tt shall be modifiable, If "F" pressed mode shall change to stop mode With number buttons v shall be modifiable,	1	In progress
25	Keyboard Button Actions chain mode	If "F" pressed mode shall change to stop mode	1	In progress
26	Telnet Button Actions chain mode	If "F" pressed mode shall change to stop mode	1	In progress
27	Hardware	The system shall be implemented on the lab boards in the Embedded Systems Lab in U131.	1	In progress
28	Used Technology	The conveyer belt shall be programmed with the programming languages C/C++.	1	In progress
29	Changes	If a requirement changes, the explicit border wall	1	In progress

30	Profile parameter v	In chain mode, velocity-parameter v shall be 1800rpm	1	In progress
31	Profile parameter tr/tf	In chain mode, acceleration-time tr and tf shall be 1 second long.	1	In progress
32	Profile parameter tt	In chain mode, the parameter tt shall be 8 seconds.	1	In progress
33	Change mode	The Mode of Operation shall only be changeable in stop state and error state.	1	In progress
34	Extra Task Stop	If the conveyor is in service mode, the running profile can be interrupted at any time.	1	In progress
35	Extra Task Time	If the conveyor is in service mode, the time parameters tt, tr and tf of the profile are modifiable via a local telnet connection and directly from the keyboard.	1	In progress
36	Extra Task FTA	A complete bottom down Fault Tree Analysis shall be performed for the system.	1	In progress
